

# Should Cars Be Driven at Night?

There are two sides to this issue. Many people agree that cars should be driven at all hours of the day, however, other people believe their use should be restricted and they should not be driven after dark.

Some people believe cars should be allowed to be driven at all hours of the day. Many people require cars for transport and it would be unfair to restrict when they can and can't use them. Shift workers work unusual hours and are required to travel when many of us are sleeping. If using a car was restricted to daylight hours, shift workers would not be able to work and would therefore lose money.

On the other hand, some people believe that car use should be restricted after dark as they can be very noisy. Although it is unlikely car noise will wake heavy sleepers, it is possible that it could wake light sleepers, especially in cities. This could lead to annoyed and irritated residents, who may complain about the noise. Using cars after dark could cause an increase in people seeing doctors because they have not been able to sleep well.

In addition, most car accidents occur at night because it is harder to see, and sometimes people are tired when they get behind the wheel of a car. If car usage was restricted to the day, this may lead to a decrease in accidents and deaths on our roads.

In conclusion, there are arguments for and against cars being driven at night. It is very important to remember that cars are an important part of living, and it is our responsibility to use them correctly. Although the arguments against cars being driven at night are convincing, I believe that this should be allowed, as long as it is done with great care.
