

The Moon

I know we haven't been able to complete our science topic 'Earth and Space' so here is an activity to keep us discovering more!

If you are unsure, have a look online and do some research and remember you can always message to ask us for help!

Blue - mild

Orange - Spicy

Purple - HOT

Sorting Moon Facts

Decide if the following statements are true or false.

The Moon travels around the Earth.

We see both sides of the Moon.

The Moon makes its own light.

The Earth travels around the Moon.

You need a powerful telescope to see the surface of the Moon.

The Moon reflects the light of the Sun.

The Moon is much smaller than the Earth.

You can see the surface of the Moon using a small telescope.

We always see the same side of the Moon from Earth.

The Moon is much bigger than the Earth.

It takes 27.3 days for the Moon to travel around the Earth.

It takes a year for the Moon to travel around the Earth.

Sorting Moon Facts

Decide if the following statements are true or false.

The Moon orbits the Earth.

We see both sides of the Moon.

The Moon creates its own light source.

It takes a year for the Moon to travel around the Earth.

You need a powerful telescope to see the surface of the Moon.

The Moon reflects the light of the Sun.

The Moon is much smaller than the Earth.

Craters are holes created when space objects hit the Moon's surface.

We always see the same side of the Moon from Earth.

The Moon is much bigger than the Earth.

It takes 27.3 days for the Moon to travel around the Earth.

The Earth orbits the Moon.

Craters are holes created by mining on the Moon.

You can see the surface of the Moon using a small telescope or binoculars.

Sorting Moon Facts

Decide if the following statements are true or false.

The Moon takes 27.3 days to orbit the Earth although a Lunar Month is 29.5 days.

We see both sides of the Moon.

Mars is the only other place in our Solar System where humans have landed.

The Moon is Earth's only natural satellite and the fifth largest in the Solar System.

You need a powerful telescope to see the surface of the Moon.

The Moon has an atmosphere similar to Earth's.

The Moon is about four times smaller than the Earth and it was formed 4.5 billion years ago.

Craters are holes created when space objects hit the Moon's surface.

We always see the same side of the Moon from Earth.

The Moon is about four times bigger than the Earth and it was formed 4.5 million years ago.

The Moon is Earth's only man-made satellite and the smallest in the Solar System.

The Earth takes 27.3 days to orbit the Moon although an Earth Month is 29.5 days.

Craters are holes created by mining on the Moon.

You can see the surface of the Moon using a small telescope or binoculars.

The Moon has a very thin atmosphere and temperatures vary from very hot to very cold.

The Moon is the only other place in our Solar System where humans have landed.
